

Baton

A clear account handoff for GTM teams

Why I built it

When an account moves between internal teams, the next owner needs a quick, reliable view of the customer: what was sold, what matters now, and what still needs a decision. Baton turns that handoff into one account deck so the new team can start with the right context and open work.

Simple assumptions

A person starts each handoff. In a future Salesforce integration, automation could flag a handoff when a Closed Won deal has the needed fields populated. The person reviews the account and confirms the handoff.

A concrete example

Terrapin Touring Co. moves from Sales to Product Onboarding on September 16. The deck captures the customer goal, key contacts, and the work Sales promised. When the account moves again, Baton adds the new handoff to the same deck and keeps the earlier record in place.

Human in the loop

AI helps organize the information and point out missing details. A person reviews the deck before using it, confirms what is true, and decides what should happen next.

How Baton works

1

Salesforce automation flags a possible handoff when required fields are complete.

2

A person reviews the account and triggers the handoff. Baton creates or updates the deck.

3

The team reviews the deck, completes open items, and leaves feedback so the next handoff gets better.

What I would add in production

Connect Baton to **Apollo's API** for account context and add Salesforce automation that prepares a handoff draft when required fields are complete. A person still reviews and triggers it. Add **feedback on every deck** to improve the checks over time.
